

# The Porto Tolle CCS demonstration project

Pietro Barbucci

**Enel - Engineering & Innovation Division** 

**CSLF Technical Group Meeting** 

Edmonton, 19 May 2011

## Content

- •The Porto Tolle CCS demonstration project: objectives and status
- The R&D activities supporting the development of Porto Tolle demo
- Regulatory and financial challenges in demostrating CCS

# The Porto Tolle CCS demonstration project Objectives and status

# The Porto Tolle power plant conversion project

#### **Old Plant**

- Gross power output (MW)
- Net efficiency (LHV)
- •Fuel
- Emissions SO2/NOx/Dust (mg/Nm3)

#### **New Plant**

2640

39%

Oil (0,25% S)

400/200/50

1980

45%

Coal

80/80/7 (daily basis)

#### **√New main components:**

- USC boilers
- Steam turbines
- SCR denitrification system
- •FGD plants
- Fabric filters
- 2 domes for coal storage

#### √Biomass co-firing capability

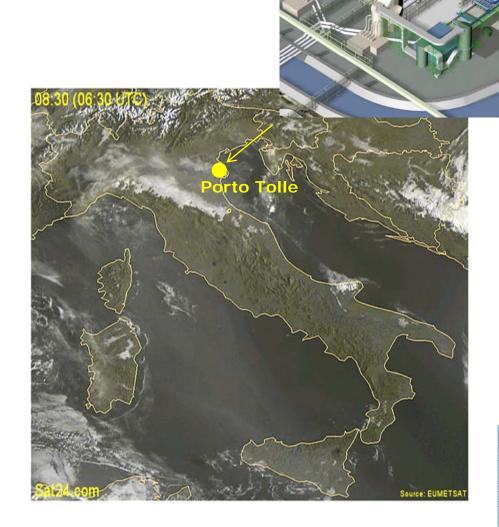

Construction permit for the new plant issued Jan 5, 2011

The Enel's CCS demo project

#### **Project goal**

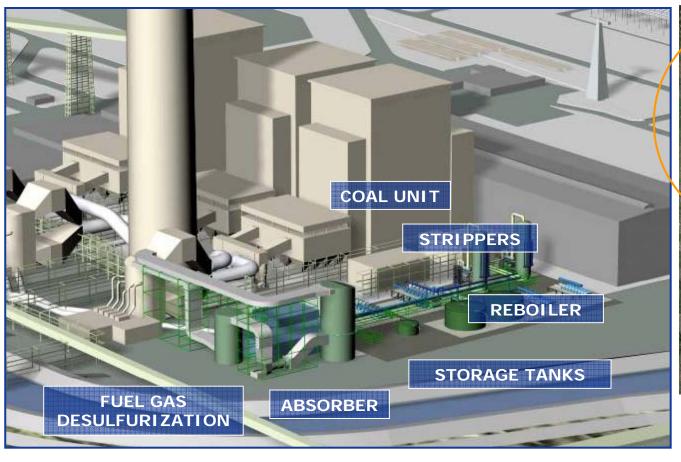

To retrofit one 660 MW<sub>e</sub> coal fired unit of Porto Tolle power station with CO<sub>2</sub> post combustion capture equipment and start CO<sub>2</sub> underground storage in an off-shore saline aquifer by 2015

**CCS de**mo plant lay-out

#### **Porto Tolle power plant**

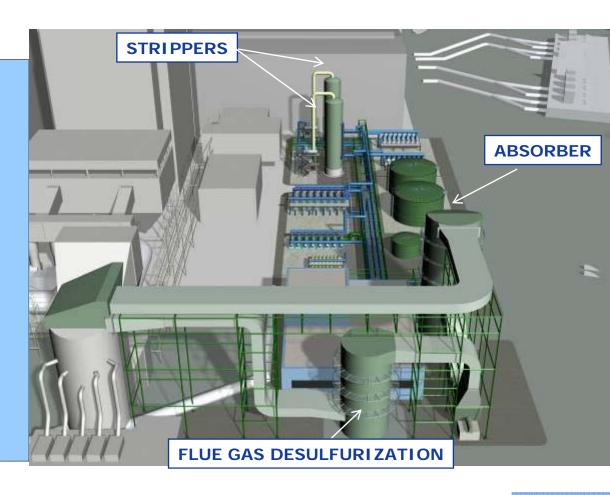

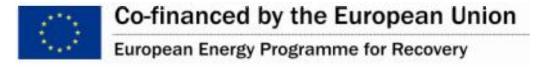

CO<sub>2</sub> storage area (light-blue)

#### **Demo main features**

One of the six EEPR projects

Total EEPR funding: 1 b€ SELECTED PROJECTS Helsinki CO, CAPTURE AND STORAGE Stackholma Moskva Minius, Warszawa Belchatów Luxembourg - Wien Bratislaya Budapest Ljubljana o Zagreb Madrid **Porto Tolle** Oxy-fuel CFB Post-combustion On shore saline aq. Off-shore saline aq.

#### Project time schedule

# CCS demo workflow strategy - 1 Capture

Lab scale
Research center - Brindisi

Flue gas: 2 Nm3/h

CO2: 0.4 kg/h

Process evaluationAnalytical protocols development

Pilot scale

Power plant - Brindisi

Flue gas: 10'000 Nm3/h

CO2: 2'500 kg/h

Performance evaluation

Emission analysis

•Tests on innovative process

Demo scale

Power plant – Porto Tolle

Flue gas: 810 000 Nm3/h

CO<sub>2</sub>: 180,000 kg/h

Technology scale up

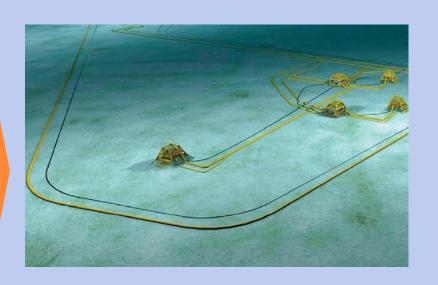

# CCS demo workflow strategy - 2 Transport

# Power plant - Brindisi Power unit stack Material test section Capture plant CO2 2,5 t/h Pilot pipeline loop

- Validate design models (both stationary and dynamic) of the CO2 transport line
- Optimize operating procedures
- Study corrosion problems related to the presence of impurities in the CO2 stream

#### Demo scale

Power plant - Porto Tolle

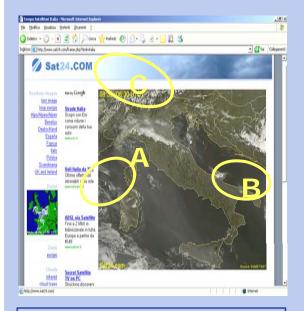

Subsea pipeline ~100 km

# CCS demo workflow strategy - 3 Storage

#### Basin scale Italy

Estimation of the CO2 geological storage potential in Italy, focusing on the areas next to main CO2 source.

Cesi Ricerca project
GeoCapacity EU project

Regional scale
Northen Adriatic sea

The correlation between the borehole information and the available seismic lines led to the mapping of the reservoir and caprock depth.

Public data

# Local scale Storage structures

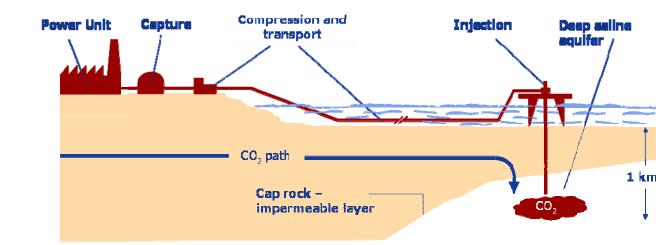

A characterization of the selected area was performed revealing that it is constituted by several structures.
Static and dynamic modelling are ongoing

Property dataField data

## **ZEPT – CCS Demo Activities**

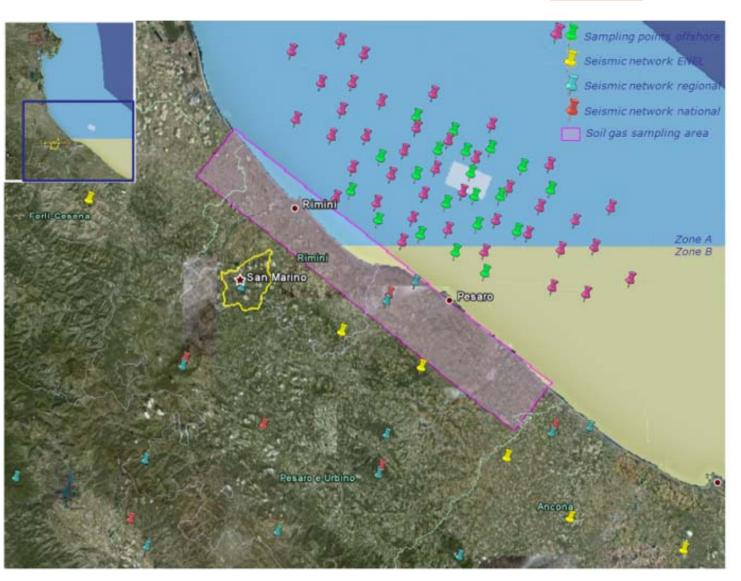

## **Activities in progress:**

- •Selection of the CO<sub>2</sub> capture technology: execution of 4 parallel FEED's under way (completion Apr. 2011; selection Jun. 2011)
- •Development of the FEED for transport pipeline and injection infrastructure (contract award Jun. 2011)
- •Selection and assessment of the storage site: geological site modelling, appraisal well design and monitoring plan in progress
- Development of the financial plan

# Enel project Baseline surveys

Based on request of European Directive on CO<sub>2</sub> geological storage it was planned to evaluate CO<sub>2</sub> baseline before injection.

# R&D activities supporting the development of Porto Tolle demo

# **ZEPT**- R&D Supporting Activities CO<sub>2</sub> capture pilot plant

- •At the site of **Brindisi** coal fired power station a pilot plant for CO<sub>2</sub> separation via amine scrubbing was built and is now in operation. The pilot plant is installed on the Unit 4.
- •The pilot plant is composed by a flue gas pretreatment section (able to remove completely the particulate and the SO<sub>3</sub> and to reduce SO<sub>2</sub> level below 20 mg/Nm<sup>3</sup>) and by a CO<sub>2</sub> separation unit
- ■The plant size is 10.000 Nm³/h of flue gas, capturing up to 2,5 t/h of CO₂
- •Goal: to gain experience in CCU designing and operation, and to assess the environmental impact of the process

# **ZEPT-** CO<sub>2</sub> capture pilot plant

- ✓ About one year for site construction activities
- ✓ Less than 2 years to firstCO2 separation since detailedengineering start
- ✓Operation start: Oct 2010

## **ZEPT-** CO2 capture pilot plant

#### **Research Program Objectives**

#### Develop operational experience (MEA 20%- 30%-40% + inhibitors)

- Assessment of the MEA absorption technology: reliability, environmental impact, power consumption and capture performance
- ➤ Definition of operating procedures, management
- Cost evaluation at different operating conditions for retrofit application: solvent consumption, inhibitors, waste treatment management
- Flue gas composition: CO2 stream and emissions

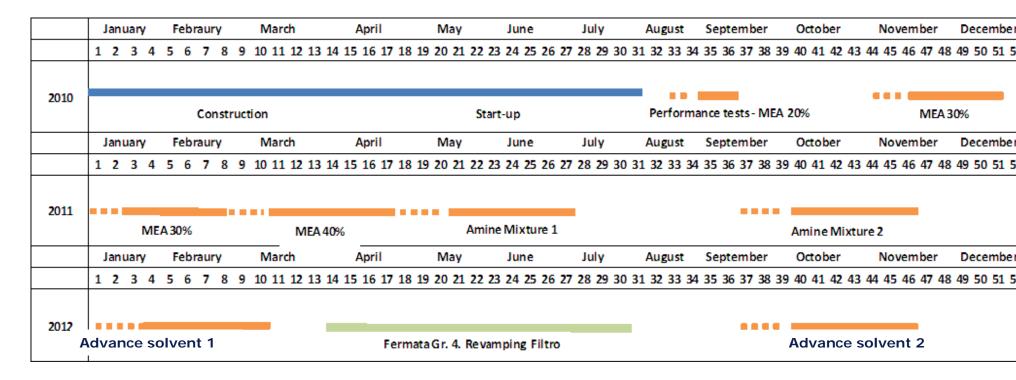

#### Test advanced solvents and inhibitors

- ➤ Reduction of power consumption (reduction of operating cost)
- Solvent degradation (reduction of operating cost)
- Assessment of corrosion (reduction of capital cost)
- ➤ Reaction rate (check of design parameters)
- ➤ Environmental performances

# **ZEPT-** CO2 capture pilot plant

#### Tests schedule

- 2011 → 4000 hr continuous operation; ~ 8000 ton of separated CO<sub>2</sub>
- 2012 → 3000 hr continuous operation; ~ 6000 ton of separated CO<sub>2</sub>
   Tests with advanced solvents

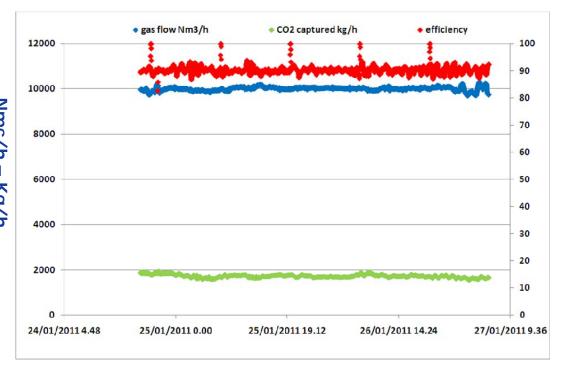

# **ZEPT-** CO<sub>2</sub> capture pilot plant

#### Test campaign with 30% MEA

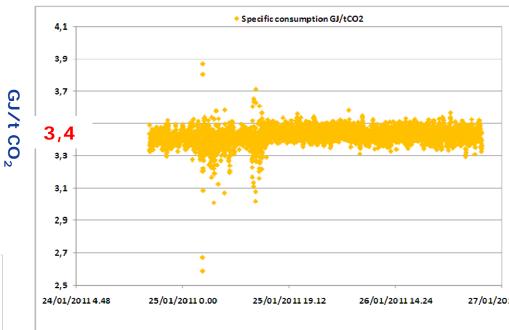

The following settings have been applied in the 500 hours test (Jan 07 – Feb 11; continuous operation):

- Flue gas flow: 10.000 Nmc/h
- Solvent flow: 30 mc/h
- Stripper pressure: 0.8 barg
- Corrosion coupons are installed:

CS 018; SS 316; SS 304

#### Steam consumption: ~ 3.4 GJ/t CO<sub>2</sub>

Average CO<sub>2</sub> capture: ~ 90 %

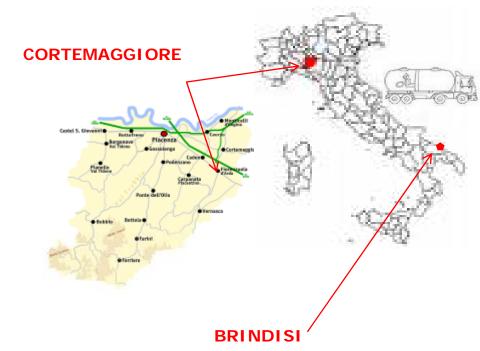

# **ZEPT** – R&D Supporting Activities

#### Integrated CCS pilot project

- •The first Italian integrated CCS pilot project is under development in the frame of the Eni Enel cooperation agreement signed in 2008. It will include:
- ✓ Capture Enel's post-combustion capture pilot plant in Brindisi in operation from Oct. 2010 and separating at least 5000 tCO₂/y
- ✓ Liquefaction CO₂ liquefaction and criogenic storage system to be built in Brindisi treating the CO₂ produced by the pilot capture plant
- ✓Transport by truck
- ✓ Storage Eni's pilot CO₂ injection project in an exhausted gas field in Cortemaggiore (Piacenza). Injection start: summer 2012. 
  Total CO₂ injected: 24000 ton
- •It is also foreseen to build in Brindisi a closed loop CO<sub>2</sub> pilot pipeline to develop knowledge to be used in the demo transport system design.

# **ZEPT** – R&D supporting activities

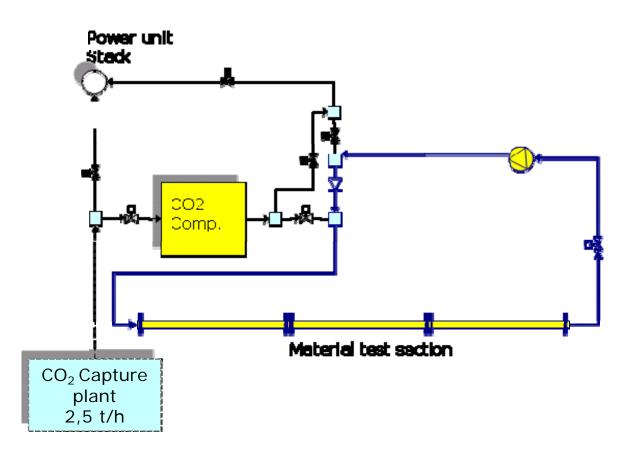

CO<sub>2</sub> pilot pipeline

This will allow to collect experimental data to be used to:

- Validate design models (both stationary and dynamic) of the CO<sub>2</sub> transport line
- Optimize operating procedures
- •Study corrosion problems related to the presence of impurities in the CO<sub>2</sub> stream

Pilot pipeline loop

# Regulatory and financial challenges in demonstrating CCS

# **Itali**an regulatory framework

The trasposition of the European Directive 2009/31/EC on CO2 geological storage into the Italian legislation is well advanced:

•The tool used is a Legislative decree. This is an act from the Government which was empowered by a vote of the Parliament (Law 96/2010, the so-called "Legge comunitaria 2009").

Process status

May 2010 First draft of the decree

Jun - Oct 2010 Stakeholders consultation

Nov 2010 - Feb 2011 Legal review

23 Mar 2011 Approval by Council of Ministers

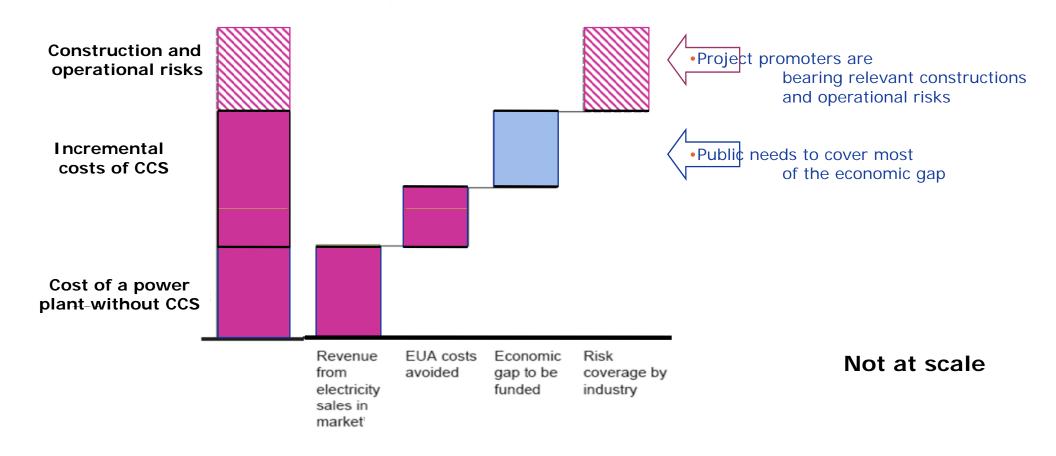

By end May 2011 Opinion from Parliament Commissions

Mid June 2011 (expec.) Final approval and publication

- •According to the draft text **the competent authority** in the permitting process is the **Ministry of the Economic Development** in concert with the **Ministry of the Environment**.
- Details about the implementation of some articles will be contained in ministerial decrees to be issued within 6 months from the publication of the legislative decree.

# Financial feasibility of CCS demos

The economic gap for a typical CCS demo project is of the order of 1b €

# Public funding assumptions for ZEPT demo

•A grant from the **EEPR** fund → 100 M€ under the Grant Agreement signed in Dec. 2009

•A substantial contribution from **NER 300** fund 

Proposal presented by the Italian Government on May 9, 2011; process ongoing

•A significant funding from **Italian Government** → Under discussion. Legal basis: Law 99/2009, Law 111/2010

# **ZEPT-** Decision gates

# **ZEPT-** CO<sub>2</sub> capture pilot plant

Flue gas pre-treatment

The pre-treatment system gives the possibility to partially bypass both the WFGD and the WESP

#### Pilot plant general flow diagram

Stack

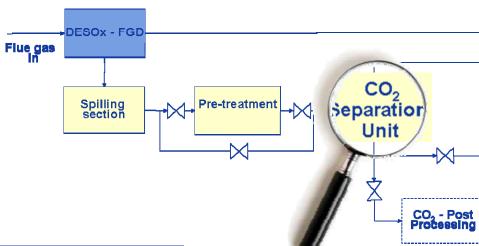

# **ZEPT-** CO<sub>2</sub> capture pilot plant

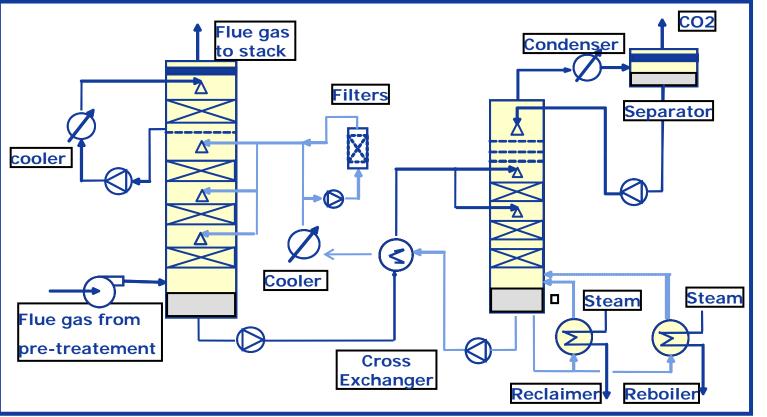

#### CO<sub>2</sub> separation unit

#### **Absorber**

- 1.5 m internal diameter
- 3 structered packing sections (22 m total)
- Solvent flow rate: 20 to 80 m<sup>3</sup>/h

## Pilot plant general flow diagram

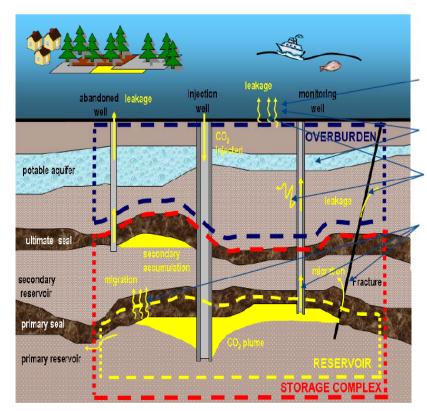

#### **Stripper**

- 1.2 m internal diameter
- 3 random packing sections(10 m total)
- Operative pressure up to 2.5 bar

# **ZEPT Monitoring Plan General objectives**

- ✓ Operational Monitoring
- Injection operation control
- Quantification of injected CO2
- ✓ Verification Monitoring
- •Well Integrity
- Cap Rock / Fault Integrity
- •CO2 displacement & fate
- Calibration of predictive models
- ✓ Assurance Monitoring
- •Impact: HSE monitoring
- Leakage and associated impact

4-Leakage quantification

3-Impact detection and evaluation

2-Leakage detection

1-Control of barriers' integrity

# **ZEPT project**Pre-injection off-shore survey

The baseline study covers a 400 km2 area around the more probable injection locations in water depths ranging from 13 to 40 m.

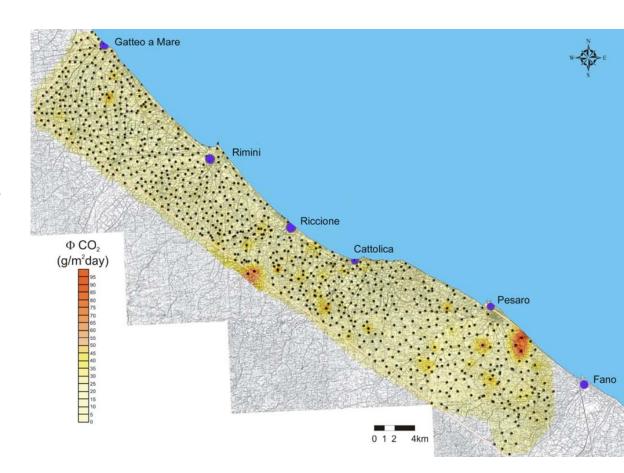

Measurements include chemical, biological and physical analyses of both the water column and the near-surface sediments during four different periods of the year to define the ranges of baseline values in the area, both spatially and temporally.

# ZEPT project Pre-injection on-shore survey

- The development of the pre-injection grid was carried out through
- ✓soil geo-gas measurements (CO<sub>2</sub> and CH<sub>4</sub> fluxes)
- ✓ geo-gas concentrations (CO<sub>2</sub>, CH<sub>4</sub>, He, 222Rn, H<sub>2</sub>S, CO, H<sub>2</sub>, N<sub>2</sub>, O<sub>2</sub>, and light hydrocarbons)
- ✓ shallow and deep aquifer fluids in terms of physico-chemical parameters (temperature, salinity, pH, redox conditions), chemical composition (major, minor and trace elements) and dissolved gases content.

# **ZEPT project Evaluation of pre-injection micro-seismicity**

Study of historical seismicity of nteresting areas.

The goal of the feasibility studies is the collection a **new passive seismic dataset**, in order to crease both the seismic behavior and the deep eological and tectonic setting of the area.

The aim of the seismic experiment is to increase the grid of the permanent seismic networks already vailable (Italian National Seismic Network and arche Seismic Network) in order to increase the ensitivity of the networks and locate earthquake ith ML <2.

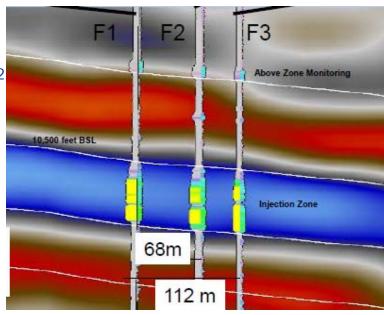

# ZEPT project Design of an seismic monitoring plan

It consists of a chain of actions involving:

- ✓ Building a model of the physical properties in the rock formations from the surface to the aquifer/reservoir;
- ✓ evaluation of the change in seismic properties varying CO<sub>2</sub> saturation;
- ✓ calculation of synthetic seismograms and topographic modelling;
- ✓ evaluation of delectability of the injected CO<sub>2</sub>, both in the hosting formation (CO<sub>2</sub> plume) and in the overlying formations (possible leakages);
- ✓ plan of the most effective seismic acquisition pattern in terms of cost/benefits and lower impact on the investigated areas (planning optimization).

# **Open** questions

- ✓Adaptation to site-specific constraints
- ✓ Definition of area of interest
- ✓ Guidelines on monitoring tools selection
- ✓ Minimum requirements in monitoring plan definition
