*Oct. 4, 2016*

# 1. Climate Change Policy & CCS

# Trend of GHG Emissions in Japan

Approx. 1400 MtCO<sub>2</sub> eq. in 2013.

Emissions by sector in FY 2013  
(excluding LULUCF)

Energy Sector  
accounts for 89%.

(Source ) National Greenhouse Gas Inventory Report of Japan (April, 2015)

# Japan's Climate change policy in a post COP21 World

## 1. Domestic mitigation measures toward the INDC

Japan's GHG emission reduction target draft by 2030 (INDC)

- ✓ **26.0%** reduction below FY 2013
- ✓ **25.4%** reduction below FY 2005

Intended Nationally  
Determined Contribution

based on a bottom-up calculation of policies, measures, & technologies.  
(CCS is not taken into account)

⇒ **Policy on CCS...Basic Energy Plan(2014)**

accelerate technology development of CCS for the practical use of CCS technology around 2020.

## 2. Promotion of Innovation

- ✓ Energy & Environment Innovation Strategy
- ✓ Innovation for Cool Earth Forum

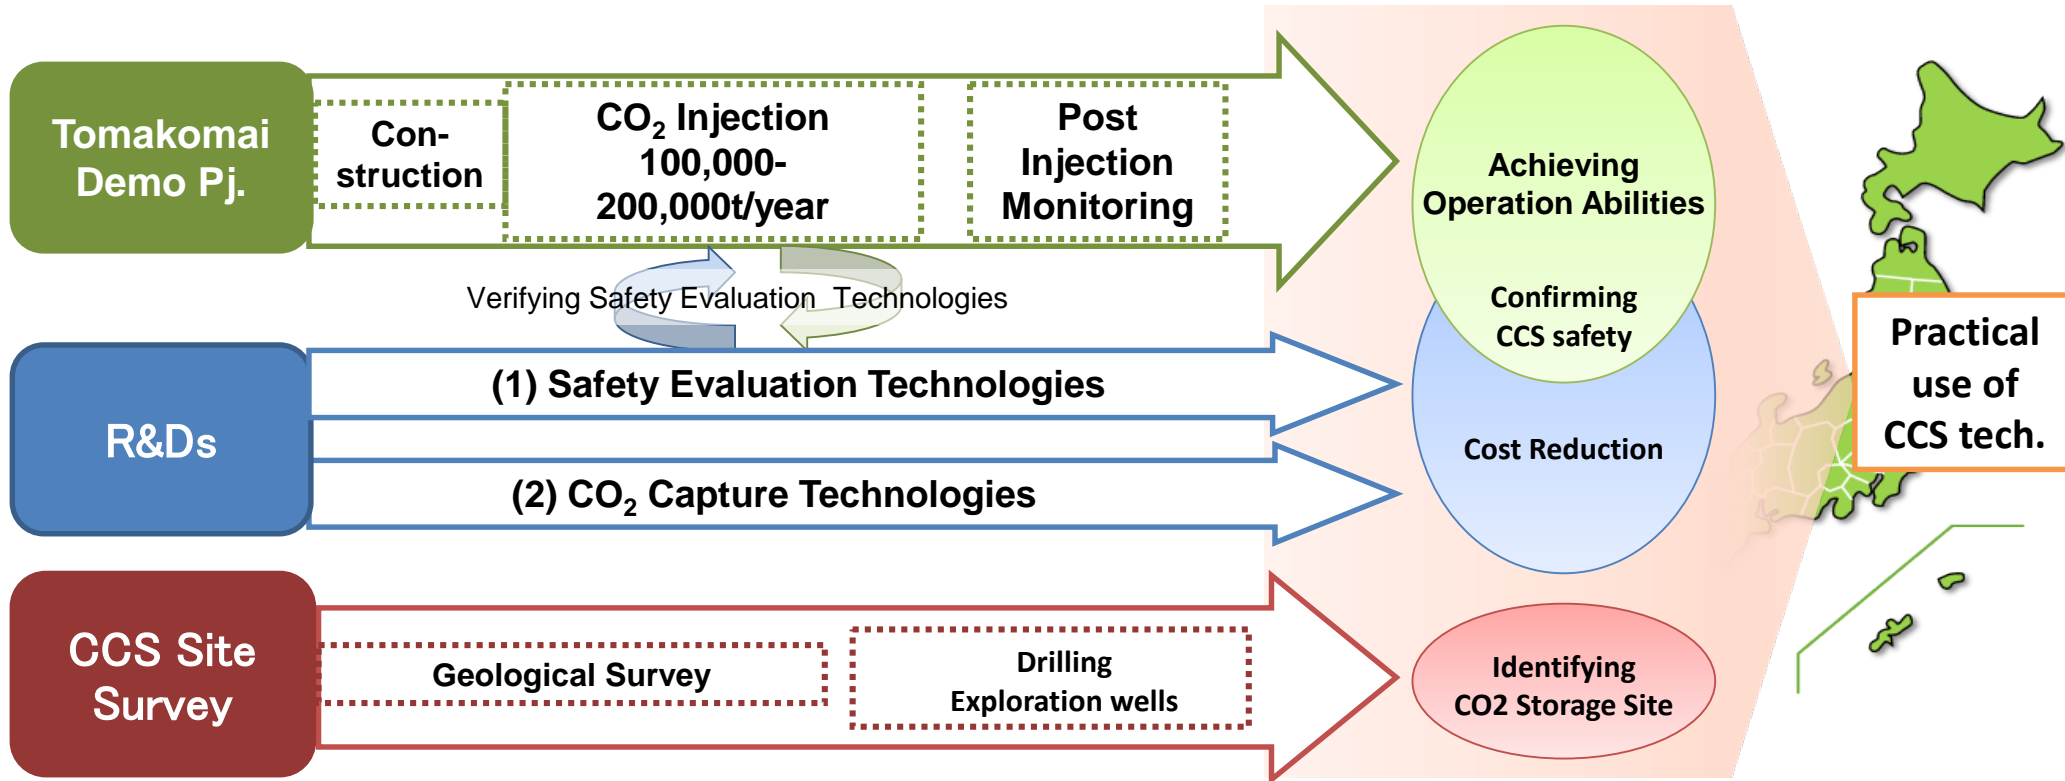

## 3. Contribution to emission reductions in developing country

- ✓ Linkage between the Technology Mechanism & Financial Mechanism
- ✓ Joint Crediting Mechanism(JCM) & other international Contributions

# Japan's CCS Policy

- To aim the practical use of CCS technology around 2020, METI conducts Tomakomai Demonstration Project, R&D projects of elemental technologies for CCS, and survey for potential CO2 storage site.

Projects / FY	2015	2016	2017	2018	2019	2020~
---------------	------	------	------	------	------	-------

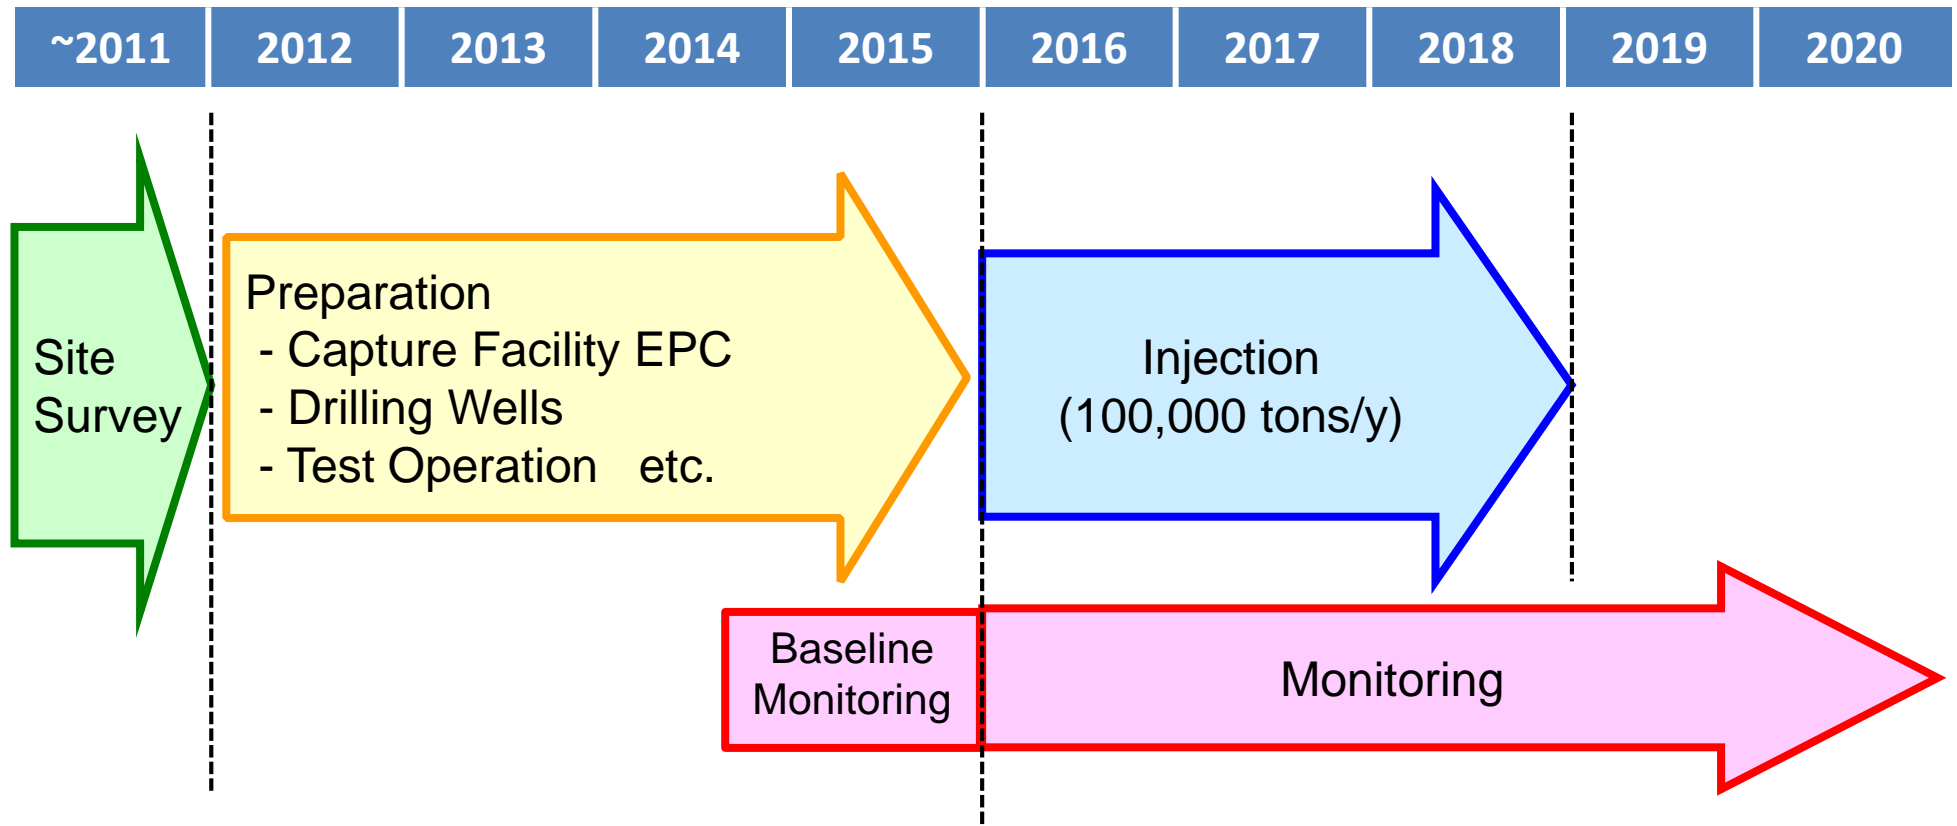

## 2. Projects Overview

(Demonstration, R&Ds, Site Survey)

# Tomakomai Demonstration Project - Schedule

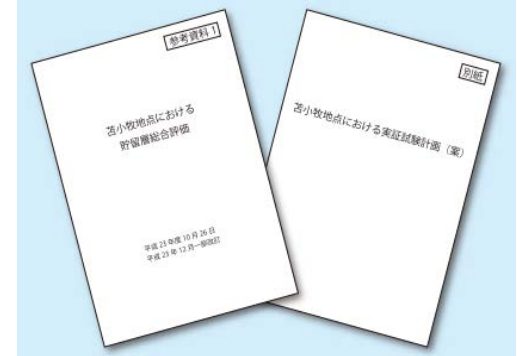

- The first large scale CCS demonstration project in Japan has started from April, 2016 in Tomakomai, Hokkaido
- Approx. 100,000 tons of captured CO<sub>2</sub> from gas emissions at an oil refinery will be injected annually, and demonstration will be conducted on such technologies as stored CO<sub>2</sub> monitoring technologies.

# Tomakomai Demonstration Project - Site Selection

Screening from 115 original candidates (by JCCS) : 2009~11

- Onshore or Offshore
- Existing wellbore data
- CO2 source etc.

## **Oct, 2011: Reports**

“Comprehensive Evaluation of Tomakomai Reservoir”

“Draft Demonstration Project Plan”

## **Specialists Council (METI) : Oct-Dec, 2011**

Discussion & Evaluation of the reports above from the technical viewpoint by third-party specialists

**Feb 2012: Final Decision @ Tomakomai**

# Capture Facility (Outlook)

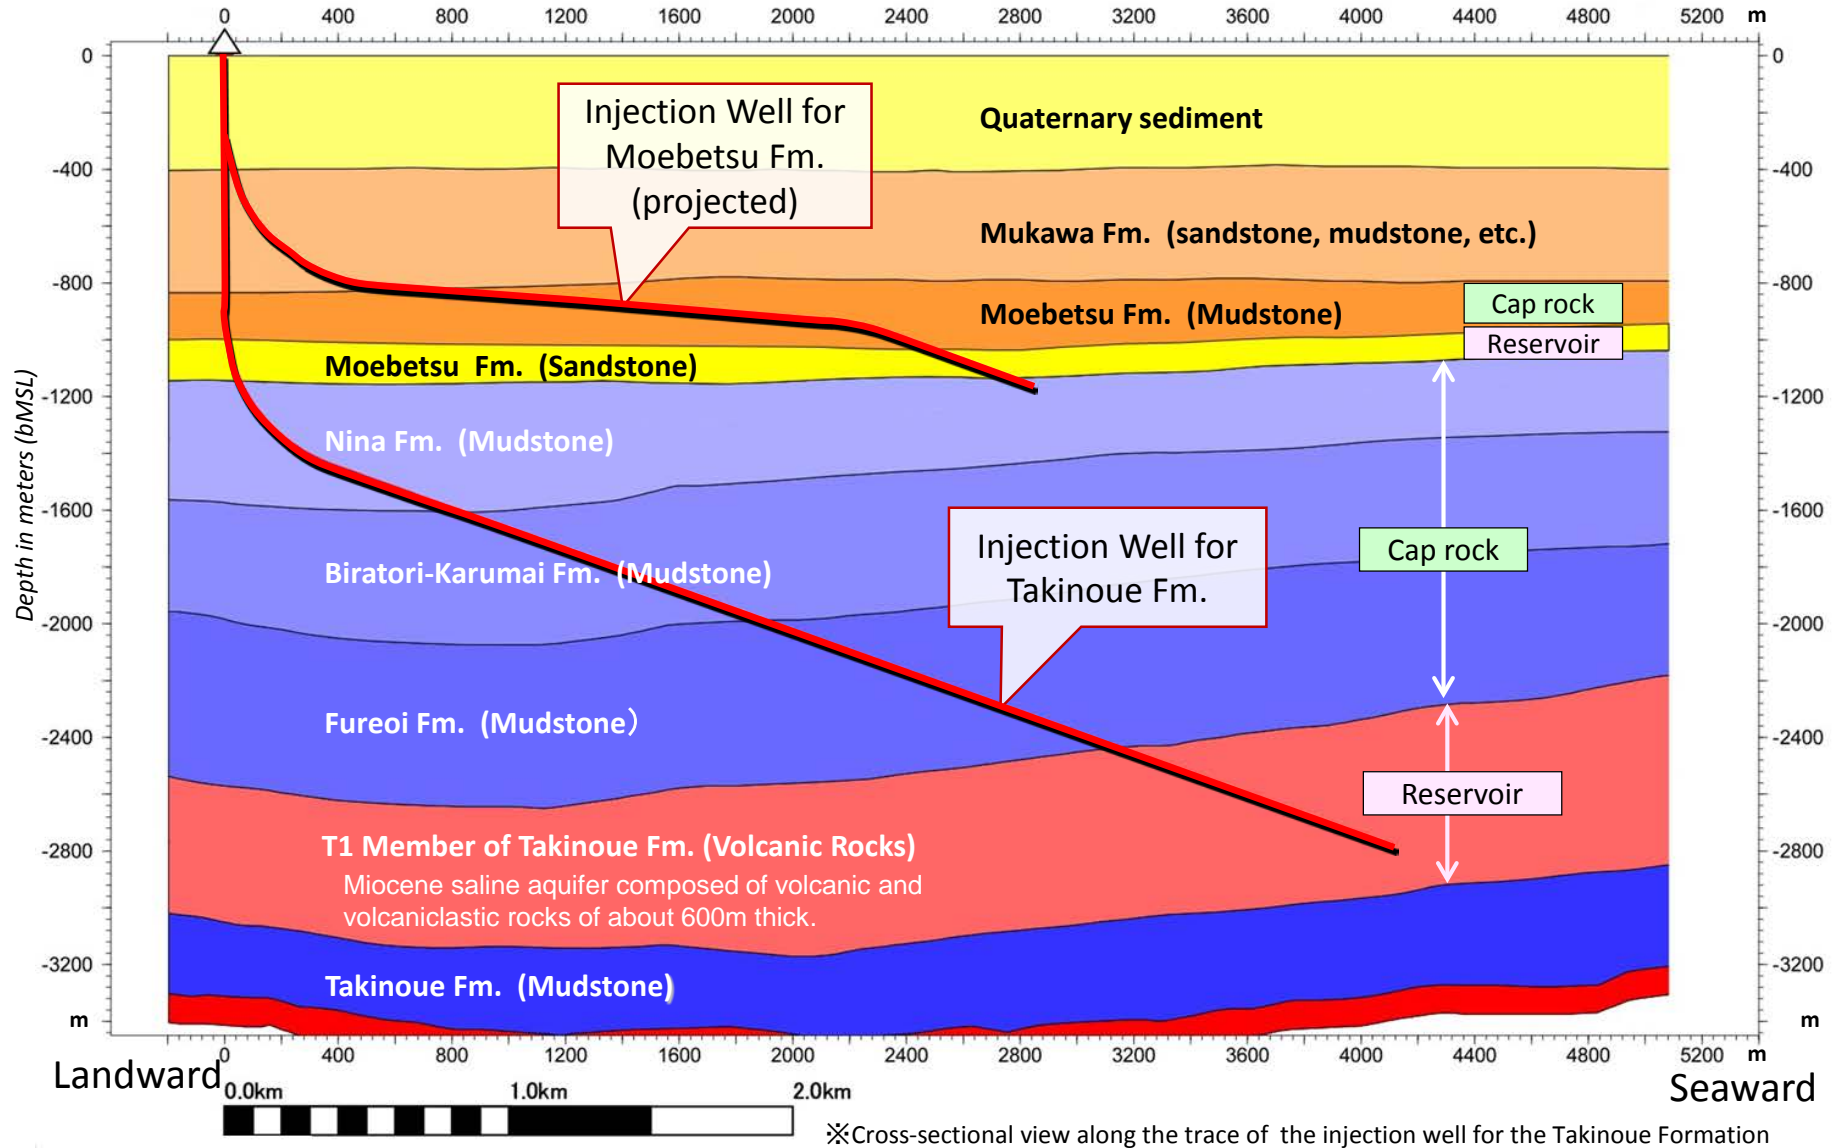

# Capture Facility (Bird's Eye View)

# Schematic Geological Design

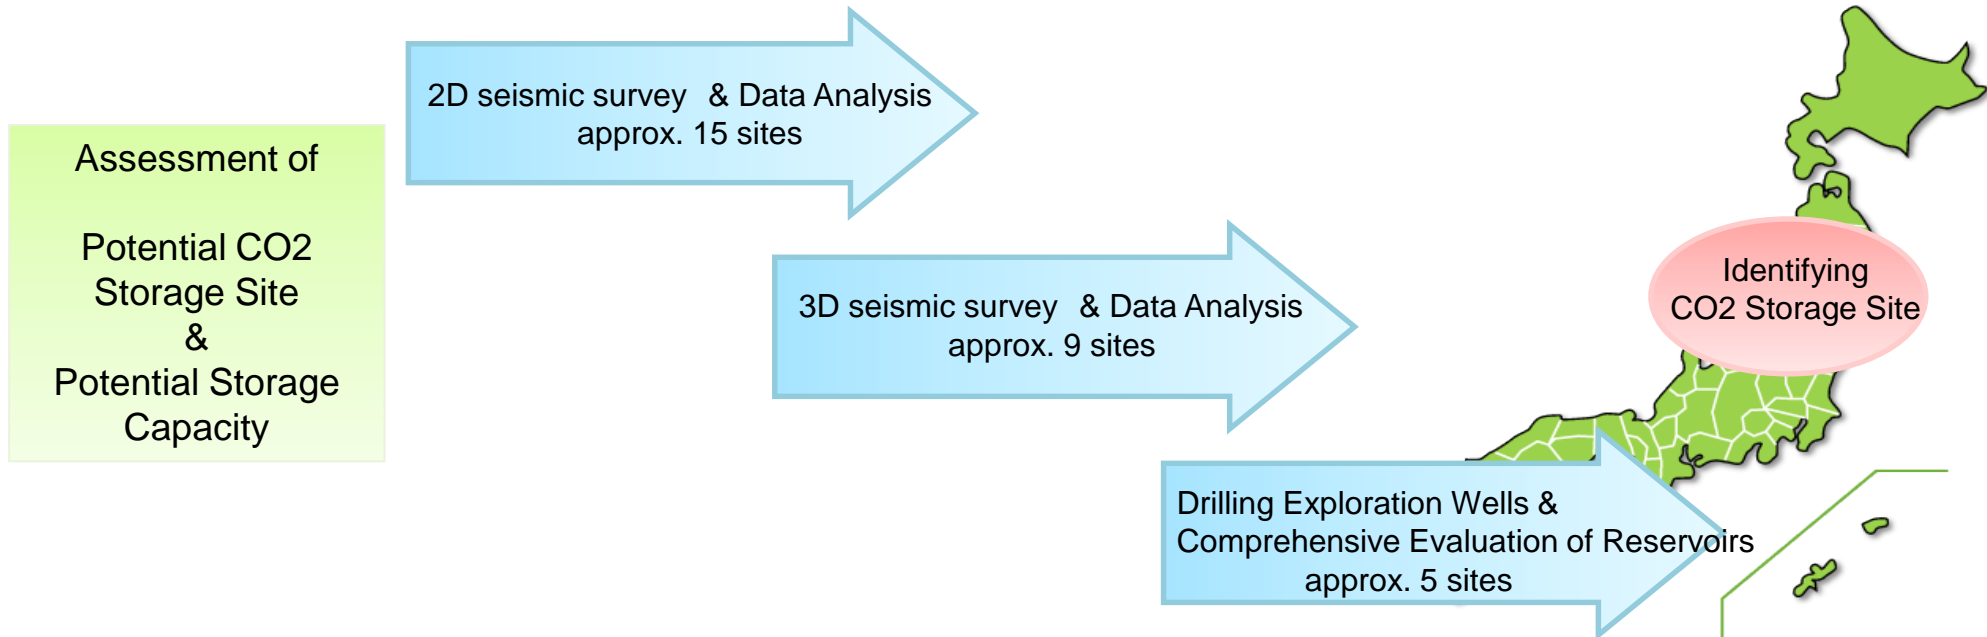

# CCS Site Survey Project

- This project is cooperatively conducted by METI & MOE. Both ministries will identify Japan's potential CO2 storage site through geological survey, etc.

(Unit: Billion Yen)

Fiscal Year	2014	2015	2016	2017	2018	2019	2020~
METI budget	1.0	1.0	1.25				
MOE budget	0.7	1.3	2.4				

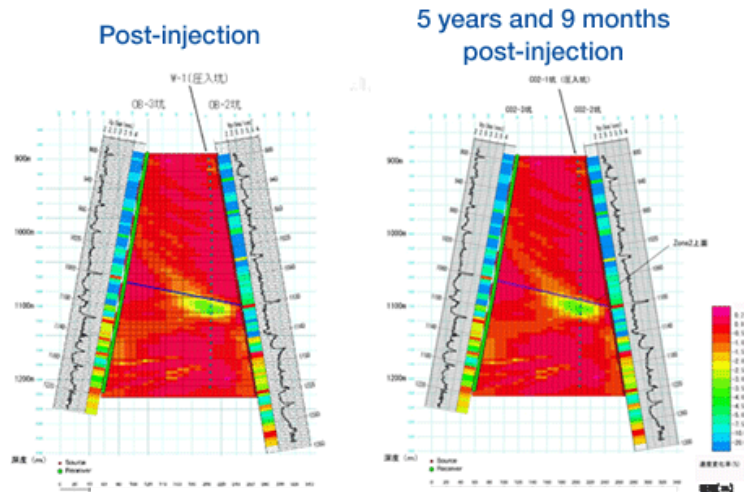

# R&D on CO2 Storage Technologies

- Behavior analysis of injected CO2 is a basic technology for CCS operation.
- The environmental effect of CCS should be evaluated for practical use.
- Target : Establishing the effective & practical monitoring system by 2020

## R&D on CO2 storage technologies

### Issues for R&D

- ✓ Accurate geological modeling
- ✓ Analysis of long term behavior of CO2
- ✓ Deployment of monitoring system

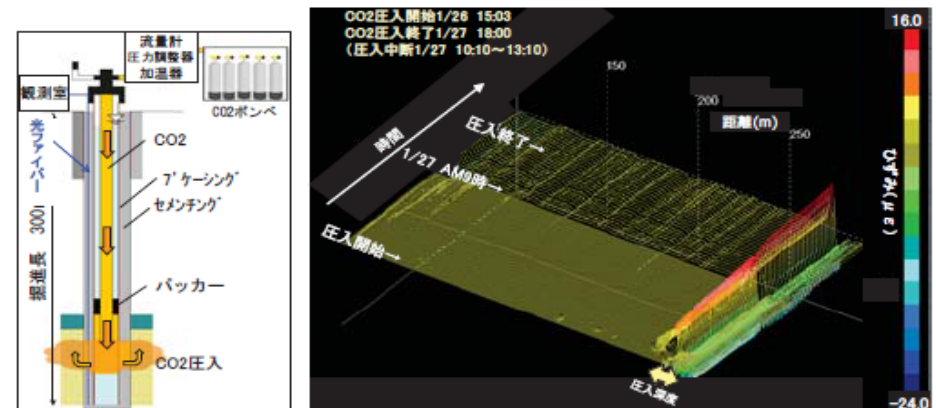

Analysis of CO2 storage status

2016/10

## Achievements & Future Task

- ✓ METI has developed fundamental technologies on monitoring & simulation by 2015.
- ✓ Cost effective & accurate monitoring system should be developed for practical use.

Monitoring technology by the use of optical fiber

14

# R&D on CO2 capture process –Solid Sorbent-

- Current CO2 capturing cost accounts for 60% of total cost of CCS in Japan.
- METI promotes R&D of low-cost capture technologies with low energy consumption and low cost.
- Target: Capture cost... 4200 JPY/tCO2 in 2005 ⇒ 2000 JPY/tCO2 by 2020

## R&D on innovative Solid Sorbent

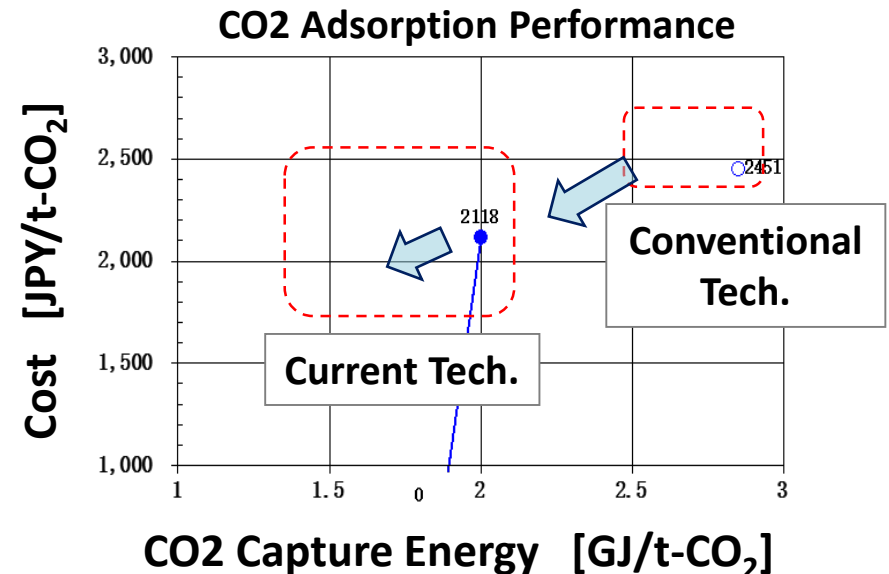

- ✓ Energy consumption for conventional liquid amine scrubbing method is high.
- ✓ Novel amine solid sorbents is expected to save energy & cost.

2016/10/11

## Achievements & Future Task

- ✓ METI developed one of the most efficient solid solvent in laboratory.
- ✓ Demonstration test is necessary.

15

# R&D on CO<sub>2</sub> capture process - Membrane Separation -

- Membrane is applicable to high pressured gas (Natural gas and IGCC, etc.) and expected as a cost effective capture technology.

\* IGCC : Integrated coal Gasification Combined Cycle

- Target : CO<sub>2</sub> capture cost ... 1500 JPY/tCO<sub>2</sub> for practical use by 2020.

## R&D on Molecular Gate Membrane (MGM)

- ✓ Only CO<sub>2</sub> molecules can pass through MGM, because dendrimer with CO<sub>2</sub> prevents H<sub>2</sub> from passing through the membrane.

### Conventional membrane

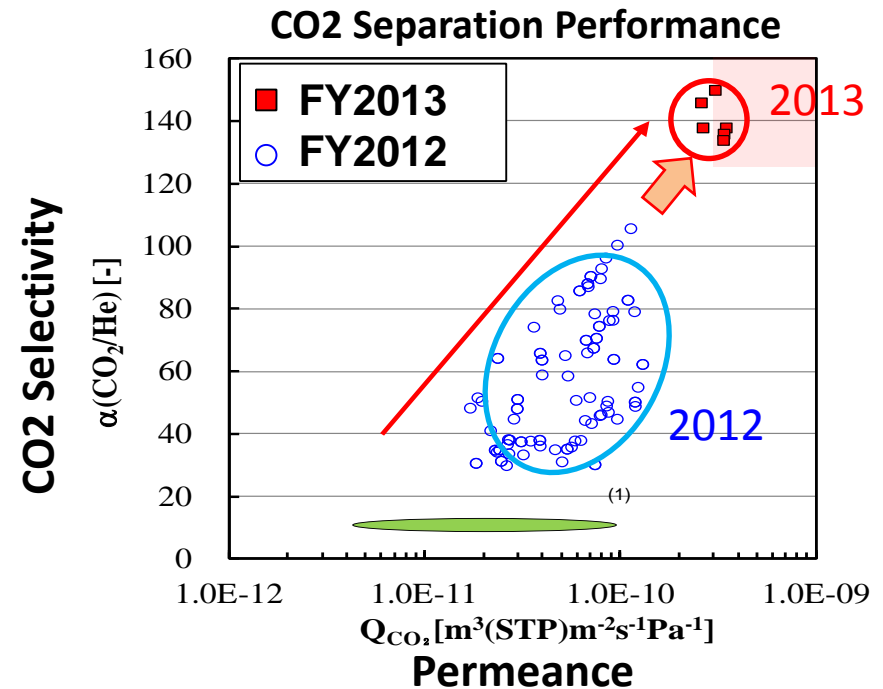

Small size of H<sub>2</sub> molecular decreases separation performance.

### Molecular Gate Membrane

## Achievement on Separation Performance

- ✓ METI achieved the highest performance of the world in laboratory.

# “Osaki CoolGen” Project

## Project Details

- To establish oxygen-blown coal gasification technology (oxygen blown IGCC) which makes it efficient and easy to capture CO<sub>2</sub>
- At the later stage, to establish IGFC, “triple-combined cycle technology” by the combination of oxygen blown IGCC and fuel cell utilizing hydrogen from oxygen blown gasification process
- The Project is now Implemented by OSAKI Cool Gen Co. (Joint Venture of J-POWER and Chugoku Electric Power Co.)

### (1) Technical Characteristics of IGFC:

- Net thermal efficiency: Up to 55% (← currently 40% by Ultra-Super Critical (USC) coal-fired power generation)
- Use of sub-bituminous coal (low-rank coal), which can be easily gasified
- Easy CO<sub>2</sub> capture by oxygen blown gasification
- Use of hydrogen from oxygen blown gasification for fuel cell

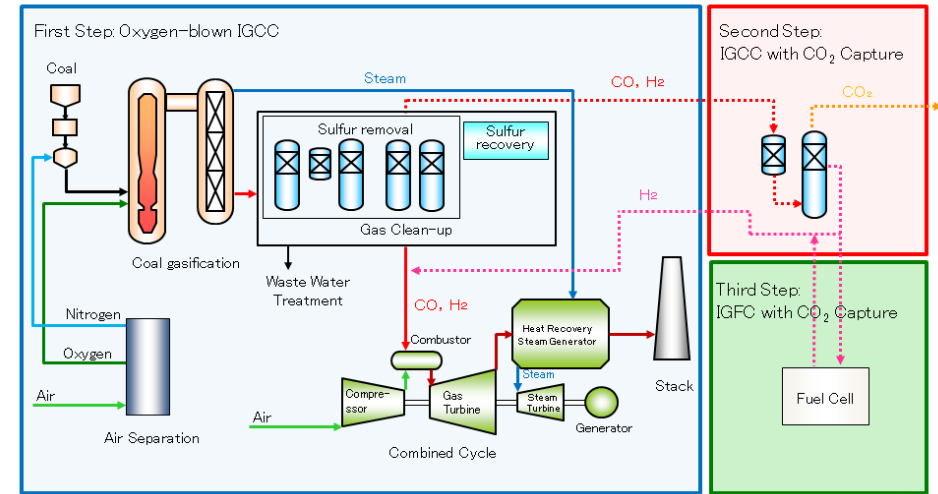

### (2) Project Period: 2012-2021

The total project costs for the 1st stage will be about 90 billion Yen, 1/3 of which will be funded by Japanese Government. The 2nd stage will be about 28 billion Yen, 2/3 of which will be funded by Japanese Government. (The costs for the 3rd stage have not yet been estimated.)

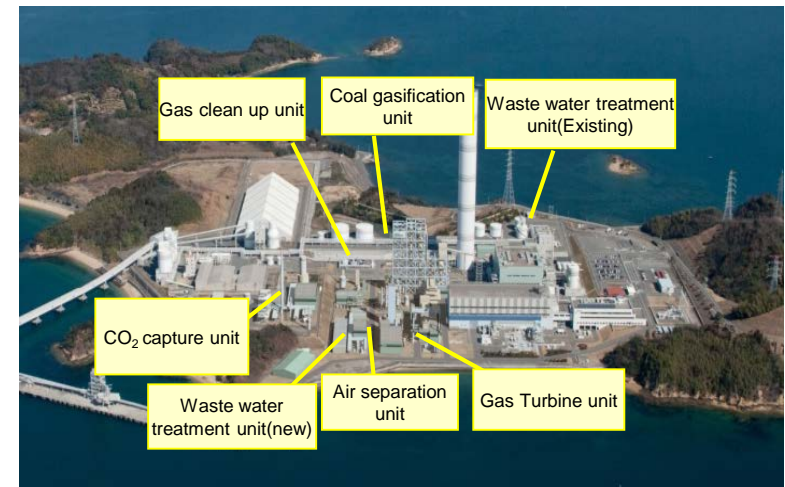

## Project Schedule

FY	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021
<b>&lt;1st stage&gt; Oxygen blown IGCC Demonstration</b>	Oxygen blown IGCC Design, Manufacturing and Construction				Demonstration test					
<b>&lt;2nd stage&gt; CO2 Capture with IGCC Demonstration</b>			Feasibility study		CO2 Capture Design, Manufacturing and Construction			Demonstration test		
<b>&lt;3rd stage&gt; CO2 Capture with IGFC Demonstration</b>				Feasibility study		CO2 Capture with IGFC Design, Manufacturing and Construction			Demonstration test	

## Project Overview

First Step (FY2012~2018)	Second Step (FY2016~2020)	Third Step (FY2018~2021)
Oxygen-blown IGCC	IGCC with CO <sub>2</sub> Capture	IGFC with CO <sub>2</sub> Capture

Project Site: Osakikamijima cho, Toyota gun, Hiroshima

# 3. Future Challenges

# Future Challenges

## ❑ Demonstration and R&Ds

- ✓ Scaling up the CCS demonstration
- ✓ Further cost reduction on Capture, Storage & Monitoring
- ✓ Establishing the effective risk management system

## ❑ Framework

- ✓ Scheme to drive private projects
- ✓ Legislation for safety operation

## ❑ Condition for CCS deployment

- ✓ Enhancing Public Acceptance
- ✓ Identifying CO<sub>2</sub> storage sites & evaluating its potentials
