Dear U.S. Department of Energy & President Obama,

Exporting LNG is not in our local public interest nore helps our local area or environment.

The Samon in our area is something to be concidered with all the stream crossing and disruption with such a line being put in; the natural stream beds with there habittats for all wildlife not just our precious fish would be disrupted significantly.

I agree with Senator Wyden in his January 10th letter to Secretary Chu, that the NERA Economic Study, based on a 2010 report, needs to be "updated with new projections, more realistic market assumptions, regional impact of the proposed actual export terminals, and evaluations on the actual impact on consumers and businesses of exporting LNG."

Senator Wyden concludes that the DOE study "is not an adequate basis upon which to approve individual applications, such as the Jordan Cove proposed export facility or the Pacific Connector Pipeline."

I ask that the Department of Energy denounce this study as inadequate and make a more realistic study of the true costs of exporting our domestic fuels.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to determine if they are of benefit to the American public.

Lindsey D.
