Subject: LNG

When you produce a product cheaper than it may be purchased from others and have an overabundance you sell it to those with a need. An example of this is several decades ago the US natural gas supply did not meet domestic demand so facilities were built for importing liquefied natural gas (LNG). This moved money from our economy to enlarge that of our suppliers thus reducing capital available for expansion.

Today the situation is reversed. Other nations do not have the natural resources to meet their need thus are seeking sources to offset their shortfall while the United States has, and will have for many years, much more than it will consume. Exporting the surplus provides many benefits for the US among them;

- In the short term it creates jobs engineering and constructing transportation systems and required facilities
- Managing and operating the systems will provide stable long-term employment
- Incoming cash generated will be available for expanding our economy.

My position as a private citizen is not doing so would be irresponsible.
