In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Larry Powers  
Deale, MD

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

David Holden

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Lisa Wise  
Richmond, TX

As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Tom Riley  
Spring Hill, TN

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Alyce Allen  
Vernal, UT

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Austin Berlin  
The Woodlands, TX

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Tammi Hitt  
Gillette, WY

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Carl Speyrer  
Conroe, TX

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Alexander Wyche  
Denver, CO

2/16/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Randy Wester

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

EMILEE MCMASTER  
STEPHENVILLE, TX

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Rufus Pevehouse  
Houston, TX

Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Marvin Macip

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

William Huckins  
Wasilla, AK

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

John Aitken  
Missoula, MT

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Dan Pearce  
Sheridan, WY

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Barbara Smith  
Port Arthur, TX

2/16/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

johness bourgeois

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Kyle Wittenberg  
Houston, TX

Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Shawna Vordokas  
Houston, TX

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Kenneth Deroche  
Bourg, LA

2/16/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Lee Pilling  
Canonsburg, PA

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Matt Ralls  
Houston, TX

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

John Karish  
Katy, TX

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Candice Elliott  
Houston, TX

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

MANLY D. BRELAND

As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Richard Rhoades  
Rifle, CO

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Ben LeRoy  
Ocala, FL

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Jeffrey Garrison  
Plainfield, IL

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Roger Boone  
Whitehouse, TX

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Dianne Jopling  
Dallas, TX

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Lee Warren  
Houston, TX

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Ron Harrelson Jr  
Florence, SC

Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

John Thaeler  
Spring, TX

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Keith Fowler  
Seabrook, TX

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

David Youngerman  
Dayton, OH

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. The study commissioned by DOE states the following: "\"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports.\"" The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue. In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security. In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Wayne Adamson  
Annapolis, MD

Dear Secretary Steven Chu,

As a consumer of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey. Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry. Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States. Concerns about domestic natural gas prices rising seem to be overstated. Only over regulation will cause prices to increase. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices. In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following: "Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."
