"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Steve Heraty  
San Diego, CA

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

John Janssen  
Moreno Valley, CA

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

William Cleveland, Esq  
Sugar Land, TX

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Andy Withers  
Raleigh, NC

As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Winston Harriott  
Laurel, MD

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Dan Azelton  
Wallace, MI

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

R. Wayne Adams  
Blackfoot, ID

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Leo J. Schwartz III  
SAN ANTONIO, NM

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Steven Marmande  
Houma, LA

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Phillip Truette  
Fayetteville, NC

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Frank Jreij

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Curt Pedersen  
Tucson, AZ

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

William Bahlburg  
Plano, TX

As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Tammy Dyer  
Killeen, TX

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Nick Dunse  
Taunton, MA

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Joe Baker  
Whiteland, IN

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Mary Young  
Gentry, AR

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Phiane Sayarad  
Richmond, CA

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Edward Campbell  
Cottonwood, AZ

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

brian scofield

As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Marion Spiers  
Houston, TX

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Ed Ginter  
Fort Thomas, KY

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Thomas White  
Punta Gorda, FL

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Ronald Rockwell  
Troy, PA

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Milton Chancellor  
Northport, AL

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Helen Cole

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Shirley Allman  
Johnson City, TN

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Bill Kurtz  
St.Croix Falls, WI

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Rob Beecham  
Sewickley, PA

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Carole Harmon  
Edgewood, NM

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Laura Ketcham  
St. Augustine, FL

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Richard Clark  
Camdenton, MO

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Gregory Paradis  
Apalachin, NY

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Allen Crane  
Martinsville, IL

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Frank Boenig  
Louisa, VA

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Gerald Keaough  
Wellman, IA

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Charlotte Fitzgerald  
Burlington, NC

As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Michael Stearns  
Centennial, CO

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Paul Schneider  
Littleton, CO

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Jim Southard  
Atoka, OK

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

ron matile

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Donald Ragsdale Sr.  
Manchester, TN

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Pat Murphy  
Houston, TX

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Jerri K Bartels  
Fort Wayne, IN

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

B. R. Kissman

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Thomas Dougherty  
Binghamton, NY

As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Monte Williams  
Missoula, MT

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

paul cerny

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Tony Seale  
Glendale, AZ

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Pamela Rutkowski  
Grosse Ile Township, MI

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Glenn Raney  
Spring, TX

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

IT Phinney  
Canton, GA

2/14/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Barbara Spencer  
Wesley Chapel, FL

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Heinz Gf. Matuschka  
Colorado Springs, CO

As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Charles Metcalfe  
Mount Vernon, OH

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Rhonda Pipp

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.
