

2/15/2013

Dear Secretary Steven Chu,

While not a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey. Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry. In addition, the job market will expand along with the new industry. Can anyone doubt this benefit??? Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States. Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "\"Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas,\"" state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices. In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following: "\"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports.\"" The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue. In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security. In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

D Douglas  
Phoenix, AZ

2/15/2013

Dear Secretary Steven Chu,

What better way to move us to renewables but, to exhaust our existing energy sources Millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry. Why not try to maximize that worth reasonably? As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the daily produced volumes from shale gas resources located in the United States. As has been demonstrated, higher gas production is cheaper at the nozzle. Across all reasonable scenarios, the U.S. is projected to gain net economic benefits from allowing LNG exports.

Sincerely,

Nick Privett  
Edmond, OK

2/15/2013

Dear Secretary Steven Chu,

We need i here to keep prices low so I can afford to heat my house. Thank you. mark

2/15/2013

Dear Secretary Steven Chu,

The oil and gas industry is a bright spot in our economy. Please help our economy thrive by supporting the export of U.S. natural gas. The proliferation of shale gas production should be a jackpot for the U.S. Currently, we can't take advantage of the opportunity because the abundant supply has saturated the market depressing domestic prices. Let's capitalize on this unexpected opportunity by allowing natural gas to be sold abroad, creating thousands of jobs and helping to stabilize the world gas market, for the benefit the global economy. I disagree with Congressman Markey's objections and don't want our economy to be held hostage by protectionism. Please support efforts to export natural gas for the benefit of our country and our economy.

Sincerely,

Jan Sieving  
The Woodlands, TX

2/22/2013

Dear Secretary Steven Chu,

Sending our liquified natural gas over seas creates private profit from public lands. The pollution of our environment and the addition of those extra fossil fuels let loose on our earth would have a huge impact on our children\'s future. Keep all fossil fuels in the ground where they belong. Save the earth.

Sincerely,

Patt Doyle  
Heisson, WA

2/14/2013

Dear Secretary Steven Chu,

I want to express my support of LNG exports as an employee of the oil industry. They should be approved because we'll have an abundance of natural gas that future technical advances will only increase and because pricing issues raised in opposition to increased exports appear overstated from recent analyses. The benefits of added domestic jobs, support of allies in an increasingly hostile world, and the higher net benefits and deficit reductions of unconstrained exports outweigh such concerns. Added flexibility in periods of market imbalances is a further added advantage. In a recovering economy such LNG exports create jobs, reduce trade deficits, and increase energy security.

Sincerely,

Will Ollison  
Rockville, MD

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry. Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States. Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "\"Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas,\"" state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices. In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following: "\"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports.\"" The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue. In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security. In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Porter Conerly  
Chapel Hill, NC

2/16/2013

Dear Secretary Steven Chu,

I want to express my support for approving liquefied natural gas (LNG) export permits. As a 2011 study found that millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s, but corporate management owns less than three percent of the oil and natural gas industry. Rather than delay the export of LNG, we should approve these significant projects so that the nation can enjoy the benefits. The US has an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have also led to a dramatic increase in our recoverable shale gas resources. Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such indicate that the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). One study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic prices. By becoming a larger LNG supplier to our allies abroad we could create many new liveable wage jobs here at home. The domestic job creation potential is so great that one report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The additional gas production for export would generate billions of tax dollars that federal and state governments alike really need every year, and especially in view of our soaring federal deficit. In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, and maintain production and employment levels,. In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security. Thank you for your consideration of my remarks.

Sincerely,

Ray Taylor

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Kerry Stone  
Fort Lauderdale, FL

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

joseph moore

2/22/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

William Maus  
East Palatka, FL

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Ikechukwu Igbokwe  
Fontana, CA

2/20/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Carlene Carmen

2/19/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Wilson Six  
Stanton, CA

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Larry Rozenberg  
houston, TX

As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Allan Burke  
Franklin, TN

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Tawn Harshall  
Butler, PA

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Cynthia Butowicz  
Jeannette, PA

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

robert booth

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Joanne Tesoier  
Lakewood Ranch, FL

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Milton L Johnson  
Mobridge, SD

2/16/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

thomas wright

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Larry Gibbs  
Silver City, NM

As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Leon Sylvester  
Calistoga, CA

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

DELAUN ROMIG  
Apple Valley, MN

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Paul Brockman  
Batesville, AR

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Robert Johnston  
Napa, CA

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Kenneth Koonce  
Baytown, TX

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Frances Luzynski  
Canal Winchester, OH

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Nolan Rowald  
Magnolia, TX

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Howard Roberts  
Alva, OK

As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Oscar Hernandez  
Milford, IN

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

PAUL WILLIAMS  
Willow, AK

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

TERRY GATES  
Marengo, IL

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

David Phillips  
Rochester, MI

2/16/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Leonard Bird  
Roslyn Heights, NY

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

James and Diane Hamilton  
Piney Flats, TN

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Raul Solis  
Mission, TX

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

PATRICK KUBEJA  
Meadville, PA

As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Brien Perkins  
Irving, TX

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Jan Carlson  
Marianna, PA

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

PATRICIA ALBRIGHT  
Greenwood, IN

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Lawrence Cherry  
Trapper Creek, AK

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Dennis Callaway  
Grand Junction, CO

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Anton J. Andersen  
Fremont, NE

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Steven Hyde  
Astoria, OR

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

wilfred Eckles

Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Claudine Selden  
San Augustine, TX

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Stephen Lyford  
Pasadena, TX

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Teresita Lain  
Miami, FL

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Rosejoy Stagg  
Pineville, LA

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Roseanne Price  
Lebanon, IN

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

Christopher seaver  
Houston, UT

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Anthony Shalna

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

joan wood

As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Danielle McClure  
Irmo, SC

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

James Davis

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

judy hatlevig

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

charlotte fischer  
Rancho Cordova, CA

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Leslie Warren  
Memphis, TN

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Neal Keller  
Fleming Island, FL

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

MARC DEVILLERS  
Albrightsville, PA

2/15/2013

Dear Secretary Steven Chu,

As a member of the oil and natural gas industry, I want to express my support for approving liquefied natural gas (LNG) export permits and address some of the points brought up in the comment from Representative Ed Markey.

Among other things, Congressman Markey asserts that investment benefits would not accrue widely to Americans. I disagree. As a 2011 study by Sonecon found, millions of Americans own oil and natural gas holdings through mutual funds, pensions and 401(k)s -- while corporate management owns less than three percent of the oil and natural gas industry

Rather than delay the export of LNG as suggested by Congressman Markey, we should approve these significant projects so that the nation can enjoy the benefits. As a nation, we have an abundance of natural gas. Industry advancements in hydraulic fracturing and horizontal drilling have led to a dramatic increase in the estimated recoverable shale gas resources located in the United States.

Concerns about domestic natural gas prices rising seem to be overstated. Recent studies such as the May 2012 Brookings report, entitled "Liquid Markets: Assessing the Case for U.S. Exports of Liquefied Natural Gas," state the price impact of 6 bcf/day of LNG exports would range from between two and 11 percent (12 and 64 cents). The Brookings study concludes that global markets limit how high U.S. natural gas prices will rise, showing that LNG exports would have a minimal impact on domestic natural gas prices.

In addition, by becoming a larger LNG supplier to our allies abroad, we could create tens of thousands of new jobs here at home. The study commissioned by DOE states the following:

"Across all these scenarios, the U.S. was projected to gain net economic benefits from allowing LNG exports. Moreover, for every one of the market scenarios examined, net economic benefits increased as the level of LNG exports increased. In particular, scenarios with unlimited exports always had higher net economic benefits than corresponding cases with limited exports."

The domestic job creation potential is great: an IHS report for ANGA on the economic impacts of shale gas estimates that for every 1 bcf/d of shale gas production, approximately 32,000 total jobs are supported throughout the economy. Plus, the additional gas production associated with exports would generate billions of dollars annually in much needed federal and state government revenue.

In addition, approving export permits would allow for flexibility to export in times of market imbalance, which helps the industry operate efficiently, maintain production and employment levels, and enhance U.S. energy security.

In our still fragile economy, it is crucial to approve LNG export permits to create jobs, support the American economy and increase energy security.

Sincerely,

Mary Poorman  
Houston, TX
