Comments on the NERA Study on LNG Exports

Dear Mr. Anderson,

The United States has a tremendous opportunity to capitalize on the rapid growth in domestic natural gas supply by expanding natural gas use domestically and by exporting natural gas in the form of liquefied natural gas (LNG). Opening up new avenues of free trade brings benefits to the U.S. economy by expanding investment, creating new jobs, and increasing government revenues. These benefits apply to the nation's export of cars, agricultural products and chemicals - and would hold true for natural gas, as well.

I would like to express my support for the DOE's LNG exports study by NERA, and its findings that America will benefit from LNG exports. This comprehensive and rigorous study examined all sectors of the economy and incorporated a wide range of U.S. natural gas supply and demand outlooks. The study concluded that in all scenarios, LNG exports yielded positive gains for our economy. In fact, the study also found that the benefits increase as exports expand.

The NERA LNG export study provides a clear basis for the U.S. Department of Energy to move forward in approving pending LNG export applications.

Thank you for considering my views.

Sincerely,

J. Wade
