

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

David Corrini

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

Everything I've learned recently indicates that renewable energy is a better long term energy solution for our country.

Fracking takes a lot of water, and all sources seem to agree that water is in increasingly short supply.

Let's add up all the costs of fracking before we commit!

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Charles Cairns

Faith Conroy

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Madge Miller

Department of Energy

Sincerely,

Richard Robinson

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

LNG export is good economically only if one considers only the money that would flow to the natural gas industry and the wealthiest people in our country.

What must be considered are the real increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and huge projected costs associated with environmental destruction due to fracking and disastrous health effects and healthcare costs for those affected by polluted air and water.

DOE must conduct a COMPLETE environmental and economic assessment of LNG exports to truly determine if it is to the net benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities.

We implore you to put effective rules in place to protect our country's economic and environmental interests before authorizing any exports.

Thank you. We are counting on you.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Greg and Laurie Schwaller

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Matthew Messner

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries

most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Denise Martini

Department of Energy

Suzanne Shaffer

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

Unfortunately, this industry-friendly group only concludes that LNG export is good economics by focusing almost solely on the significant money that would flow out of our pockets and go to the natural gas industry and the project investors in our country.

However, the report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

I believe that the DOE has an important responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public.

I hope concerned Americans worried about the NERA's flawed report will persuade you to conduct a full environmental impact statement for LNG exports, including the environmental and human health impacts in fracked communities. I together with all Americans deserve to know what the real costs will be to us when sending natural gas overseas.

I hope you agree that rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Patricia Fulbright

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Jonathan Willner

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

Fracking creates pressure changes that have created earthquakes. This is not a widely publicised fact but it is true. As a science teacher (Physics, Chemistry and Biology) this information is even taught at the high school level. Cause and effect relationships are often ignored and this is well documented throughout history. Some scientists often choose not to think in terms of short term or long term effects. If we remember that the pollutions in their various forms have been the unwanted byproduct of some new product or technology produced by some scientist who is only looking at the dollars that can be made. We see this in all sectors of our society - from the lead that was in our paints to the various medications that cause more problems than good. My Chemistry and Physics class have done research on the various problems caused by the pollution- side effects that have affected many lives in adverse ways.

Your agency is responsible for 'right thinking' and being scientific for the benefit of all Americans - not the companies who turn the heads to the adverse effects.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water. Illinois already cannot pay their Medicaid bill, and as southern Illinois is a large medically underserved area, with hydraulic fracturing development, pollution related medical issues and budgets would only become more dire.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

Stop fracking in southern Illinois, in our Western wildlife habitats near our National Parks, and in places like Pennsylvania where farms are at risk. Preserve our water resources, as these should be available for the health of all humanity and wildlife, not foolish corporate profit. Turn to developing more environmentally friendly, sustainable energy resources, and support job growth in this latter area.

While priorities may shift to climate change in this administration, remember that such factors here are also linked to health, and healthcare. Be mindful of the wider economic issues surrounding maintenance of Social Security, Medicare, Medicaid, and health and healthcare for all U.S. citizens. It's an interrelated system.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Sabrina H Hardenbergh

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Nadine Shumake-Clarke

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Joyce Koop

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

When used as a fuel, LNG contributes to global climate change no matter where it is used. Exporting the fuel does not export the consequences in our interdependent atmosphere. The long term economic consequences of adapting to/ coping with climate change are not a part of this 'economic study'. Therefore it is fundamentally flawed.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Liz T

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Destine Robertson

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries

most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

I have heard too many stories from residents of states where fracking is employed about polluted ground water and compromised air quality that it is imperative to fully consider the long-term impact of such practices now, before it is too late. As a resident of the beautiful state of Arkansas, I have read about the dramatic increase of earthquakes in the areas where fracking has been practiced heavily and am relieved that it has temporarily been halted.

Please exert all available resources to fully investigate this questionable practice before allowing it to continue.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Susan Barron

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Janice Richie

Jeff Czach

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Melissa Vagle

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

The total solar energy absorbed by Earth's atmosphere, oceans and land masses is approximately 3,850,000 exajoules (EJ) per year. In 2002, this was more energy in one hour than the world used in one year. Why should we invest one more penny in inefficient, polluting, warming, toxic stored carbon we dig up from Earth that will die out before most of us do anyway?

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Randi Ferine

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Kathrina Spyridakis

Department of Energy

Sincerely,

Bryce Kuchik

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

While focusing on the benefits to the gas industry, the report completely ignores or unfairly dismisses the real costs to our citizens and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, the negative impacts to other business sectors that rely on a clean environment, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water. It ignores the myriad of subsidies, both direct and indirect and should include the externalized costs

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. We deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports, including the repealing of exemptions granted to the industry in the last few years.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Chris And Cynthia Burger

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Richard Seymour

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

Sirs, Please stop personally putting the fox into the chicken house. We have very well trained scientists who are not motivated by profit who already work for the interests of the United States. Their motivation is the good of the Nation at large, not corporate growth. Exporting our natural resources is about money, not the long term needs of the country and the generations to come. If we have reserves then they are the inheritance that we must shepherd for our children...not squander because it is there.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with

environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Maralyn Dettmann

Christine Bryan

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

Anything less than a full life-cycle analysis of LNG exports will not produce an informative EIS required under NEPA. The National Academy of Science's 2012 report on methane leakage from hydrauling fracturing, from drilling to processing, storage and transportation, concluded that at the leakages levels assumed by the EPA in its VOCs NSPS regulation, there are significant climate and air quality disbenefits from natural gas production. Adding to these the significant negative impacts on water quality and land, including heightened risk of earthquakes -- as the Ohio Department of Natural Resources concluded -- it is clear LNG exporting leaves a heavy environmental footprint that must be fully examined and disclosed in the risk-benefit analysis of the EIS.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Elizabeth Entwisle

Department of Energy

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Barbara Brooks

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Syvonnie Forkin

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

I am concerned that the United States is not a leader in being both cautious and progressive in environmental means of obtaining energy. We should be investing more in wind, geo-thermal and solar energies, and less in fossil fuel extraction as a whole. I do not support the direction in which we are going.

That being said, I want you to give me information about fracking from many sources before investing in it. We should be hearing about the pros and cons from you before you just endorse one side, which is apparently a tainted reporting because of ties to the natural gas industry.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Rebecca Augustenborg

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Karen Comegys

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Neil Bastien

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

Suzanne Cook

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

It is time for a new look at energy supplies!

The current hearings scheduled before Congress will do little but pit 'feel good' energy (wind, solar, and bio-) against 'business as usual' (carbon based) energy supplies. Recent applications for a plethora of new fission power plants only exacerbate the issues for fission is both dangerous and has many hidden taxpayer costs as do the persistent advertisements about clean coal (the world's greatest oxymoron), abundant natural gas supplies, and the expected status of the US becoming an oil exporting nation in the next decade. All of these positions only confuse the public and are likely to result in an increased expenditure of tax dollars for ineffective solutions. Instead of our energy policy being based on sound bites, we need to engage in a lengthy debate about what our energy policy is and what it could and should be.

For the past 10 decades our policy has been to use the cheapest form of energy available, to foster the development of fossil fuels, to encourage the use of nuclear energy, and, more recently, to adopt the philosophically feel good energies (wind, solar, biomass) as our long term energy supply. This encouragement has been provided via tax incentives given to selective industries without any clear understanding of the consequences of these policies. And our lack of full discussion and disclosure now looks as though it will result in the taxpayer becoming responsible for the inherent and immeasurable risk that is present in the current trend. This risk is many faceted and only poorly understood and varies from loan guarantees for questionable projects, to potential radioactive discharge events like Chernobyl or Fukushima, to rising sea level that will destroy ports and coastal land, costing the world trillions of dollars

But there is another unintended policy consequence. Complacency and assurances that our energy supply is adequate has led to a position of 'no urgency' relative to implementing fusion processes as our source of future energy. Fusion is clearly the cleanest of all forms of energy for it has no CO₂ emission, cannot 'go critical', and generates virtually no radioactivity. But research, both basic and applied, has all but died for there is no source of funding, neither appropriated nor via tax incentives, for the development of the most promising long-term base-load source of energy available for the world.

Fusion research is supported at levels that are laughable by any standard.

America's total annual budget for fusion has been less than one tenth that spent on ethanol subsidies. Fusion has the potential to be THE SOLUTION while ethanol never had a ghost of a chance to make even a dent in our energy supply and subtracted from the food supply.

Inexpensive energy is what has made our country prosper. But all of our incentive efforts are aimed at developing ever more expensive sources of energy, many of which will never repay the investment that has been made in them for they are known to be impractical in terms of energy efficiency, energy availability, or demand load requirements.

To be real about what is needed to meet the energy crisis, one only needs to step back and look at where we have been. Wind, solar, and biomass have many problems becoming the base load for the 14 TW needed by 2050. The world cannot afford the CO₂ load in the atmosphere from fossil fuel that is expected to be used in the next 20-30 years.

So what is the alternative? Fusion, but not as we have been currently lead to believe to gain energy. (Laser fusion is a spoof, magnetic confinement needs a magic material for protection and plasmas are squirrely uncontrollable.)

Fusion is an energy source that has been known and generally understood by scientists for more than 5 decades. Fusion requires tremendous heat and compression for its ignition. It takes energy to provide this heat and compression and the energy one gets in return must be large enough to assure that more energy is created than the amount it took to initiate the reaction. The H bomb resulted from a small trigger yielding more than 1000 times as much yield. But controlled releases are also possible at much smaller levels that still put out 100 times as much energy as is consumed.

A controlled process to do this was defined in the 1970s by Argonne National Laboratory (ANL). But are we supporting research in these processes now? No, not one single federal dollar is directed to these promising avenues of achieving fusion through RF accelerator driven fusion reactions as researched in the 1970s by ANL. Why? The research was done in a weapons lab by the DOD and it can not be a weapon. And because the energy industry is built on the delivery of about 1GW at a location. Fusion requires the delivery of more than 10 Gigawatts of energy from one site to become economic and the driver is thought to be too expensive and cannot be made smaller. In the 1970s this decision may have been wise for the US had no need for large new sources of clean energy at the time. But now, we have an urgent need to replace a significant amount of our dirty base load facilities with sources that do not emit CO2 or other harmful products and do not go critical.

Fusion comes in many flavors, from the impractical systems that produce less energy than they consume, to the ones that produce massive amounts of radiation due to their failure to adequately shield the system from the neutrons generated by the Deuterium-Tritium fusion reaction. Only one system has repeatedly received the endorsement of hundreds of scientists and that is a system that uses a large RF (radio frequency) accelerator to provide the energy to drive the fusion reaction. It would produce no climate altering CO2 and, since all the research has been done, it could be online in about a decade.

RF accelerator driven fusion should be our showcase national energy project, but this process seems to be totally unknown. It does not have the support of the US Department of Energy and thus is unknown to politicians.

Politicians need to understand that RF accelerator driven fusion is a viable option for the replacement of fossil fuel for energy generation, NOW.

RF accelerator driven fusion is a technique that has been endorsed by leading scientists throughout the world for the past 35 years and ... it is time it was implemented.

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. The report completely ignores or unfairly dismisses the real costs to hard-working Americans and their communities -- increased costs to heat our homes and businesses, the loss of jobs in industries most affected by LNG exports including domestic manufacturing, and projected costs associated with environmental destruction due to fracking and healthcare costs for those affected by polluted air and water.

The DOE has a responsibility to conduct a complete environmental and economic assessment of LNG exports to truly determine if it is to the benefit of the American public. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Chasidy Simplot

Department of Energy

Dear Energy,

The recent economic study on liquefied natural gas exports by NERA Economic Consulting is a flawed report that must be rejected by DOE.

This industry-friendly group only concludes that LNG export is good economics by focusing on all the money that would flow out of our pockets and go to the natural gas industry and the wealthiest people in our country. A full environmental impact statement for LNG exports must be conducted, including the impacts in fracked communities. I deserve to know what the real costs will be to us when sending natural gas overseas. Additionally, rules must be put in place to protect our interests before DOE authorizes any exports.

I am sure that more diligent study will show that, indeed, individuals, their water and air, have been damaged by this method of 'extracting' resources-- and these people should be compensated and had restoration made-- that should be part of the 'cost' of fracking technologies--- maybe it *isn't* worth it?

It's time to go back the drawing board and conduct a truly independent study of how LNG exports will impact our communities.

Sincerely,

Judith Hockman

Department of Energy
